

## Laser Surgery

Oceana Veterinary Clinic offers Laser Surgery, a progressive surgical option for our patients. We have been performing laser surgery since 2010 and proud to be on the leading edge of advanced medical care.

The benefits of Laser Surgery:

- Less Pain – The laser seals the nerve endings as it moves through the tissue. This reduces the pain that your pet feels during and after surgery. Your pet will experience a more comfortable recovery.
- Less Bleeding – The laser seals small blood vessels during surgery, resulting in less bleeding and quicker procedures. This helps reduce the time that your pet needs to be under anesthesia.
- Less Swelling – With laser technology, only light comes into contact with the tissue, causing minimal swelling.
- Extreme Precision – The laser enables us to only affect or remove the target tissue, leaving the healthy surrounding tissue untouched.
- Reduced Risk of Infection – The high heat of laser energy kills bacteria and microorganisms as it moves through diseased areas, reducing the chance of infection.

Less pain, less bleeding, less swelling and a reduced risk of infection result in a quicker post operative recovery. Therefore, your pet is likely to feel less discomfort after surgery, and return to normal activities sooner.
